Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence represents the heavy chain variable region (VH) of murine anti-CD23 (FCERII) monoclonal antibody Cl1. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAV32262 and AAV32263), which comprise sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions (see AAV32459) to render them capable of binding to the CD21 type II molecule expressed on capable of binding to the CD21 type II molecule expressed on CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermaities, psoriasis, uriticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ucerative colitis, Crohn's disease, Sjogren's syndrome, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhintis, ecemm, graft-versus-host disease, COPD, insulitis, bronchitis and B-cell malignancies (particularly type II diabetes), and B-cell malignancies (claimed). They are also useful in the binding and various ligands and entity and second continuations between CD23 and various ligands and
                                                                                                                                                                                                                                                                                                                                                       Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 98; DB 21; Length 137; 100.0%; Pred.                                                                                                                                                                                                                                                                                               COR H2) of the heavy chain of murine anti-CD23 (FCERII) monoclonal antibodies, such as primeric of murine anti-CD23 (FCERII) monoclonal antibodies, such as thiered antibodies, which comprise sufficient of the amino acid sequences of Cl1 light and heavy chain comprise sufficient of the amino acid sequences of Cl1 light and heavy chain c CDRs (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on haematorpoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, crype II molecule expressed on haematorpoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, clabetes, uveitis, dermaitis, psoriasis, uriticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, crohn's disease, Sjogren's syndrome, allergies, allergic asthma, intrinaic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly from allergies) chief and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and

                                                                                                                                                                            The present sequence may be used in the activation of new ketone prodrug compounds containing active agents. The ketone derivatives are useful as carriers for antitumour agents such as cytocoxic agents, where the antitumour agent is a microtubule stabilising agent such as pacilitaxel, epothilone or its therapeutically active analogue or an anthracycline antibiotic such as doxorubicin or its therapeutically active analogue. The ketone derivatives are useful for transfeted drug delivery. The inactive molecules in the ketone compounds are converted to active molecules by retro-Michael reaction. The antibody has bifunctional activity and specifically immunoraects with cell surface antigen of a target cell. The active ingredients can be mixed effectively with excipients as per deelired amount along with the buffering agent to enhance the effectiveness and activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Indels 0; Gaps

This amino acid sequence represents the heavy chain of humanised anti-CD23 (FCERII) monoclonal antibody Cl1, composed of a human cramework (HSIGRII) and the heavy chain complementarity determining regions (see AAY32257-59) of murine antibody Cl1. The DNA was constructed by splice overlap FCR. The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimcto's thyroiditis, multiple sclerosis, capadome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Slogren's syndrome, allergic asthma, acute asthmatic exacerbation, rhinitis, ecemen, and Ecell malignancies (Claimed). They are also useful disease, and B-cell malignancies (Claimed). They are also useful determining the binding and various ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse; humanised antibody; CC-chemokine receptor 2; CCR2; nephrotropic; neuroprotective; immunosuppressive; human immunodeficiency virus; HIV infection; cytostatic; vasotropic; leukocyte trafficking; allergy; inflammatory disorder; autoimmune disorder; rheumatoid arthritis; shock;

The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglabulin of human origin. The manised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating thy infection. The proteins of the invention are useful for inhibiting or treating cleaved; autoimmune disorders such as the inhibiting settle of the invention are useful for inhibiting and multiple settle original such as the inhibiting a restences; attenced as the inhibiting restences; attenced as the inhibiting restences; attenced as the inhibiting restences; attenced as a cute inflammatory disorder also useful for treating allergy, anaphylaxis, and for inhibiting estences; actte inflammation, histamine and igg.

The inhibiting and acute inflammatory glomerulopathies, acquired theory, chronic and acute inflammatory glomerulopathies, acquired inmune deficiency syndrome (AIDS), restences as associated with vascular Humanised antibodies are also useful for inhibiting narrowing of the intervention, including angioplasty and/or stent placement in a mammal. Humanised antibodies are also useful for inhibiting narrowing of the lumen of a vessel in a mammal, and inhibiting neointimal hyperplasia of a vessel in a mammal, and inhibiting neointimal hyperplasia of the rest of the inhibiting neointimal hyperplasia of the control of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
multiple sclerosis; atherogenesis; atherosclerosis; restenosis; asthma; anaphylaxis; malignancy; inflammation; stenosis; allograft rejection; fibrocic disease; angioplasty; acquired immune deficiency syndrome; AIDS; inflammatcory glomerulopathy; vascular intervention; neointimal hyperplasia; VH; heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence may be used in the activation of new ketone prodrug compounds containing active agents. The ketone derivatives are useful as carriers for antitumour agents such as cytotoxic agents, where the antitumour agent is a microrubule stabilising agent such as pacificate, epothilone or its therapeutically active analogue or an anthracycline antibiotic such as doxorubicin or its therapeutically active analogue. The inactive molecules in the ketone compounds are converted to active molecules by retro-Actobal reaction. The antibody has bifunctional activity and specifically immunoreacts with cell surface antigen of a target cell. The active inspecifients can be mixed effectively with excipients as per desired amount along with the buffering agent to enhance the effectiveness and activity of the

binding fragment of the SM3 antibody bound to a peptide recognised by the epitope binding site of SM3. The products and methods can be used to develop agains for the detection of tumour calls and for therapy against tumours. MUCl epitope minics can also be used to prevent or decrease immune response, e.g. in the therapy of diseases caused by autoimmune responses (such as arthritis, multiple solerosis, asthma or disabetes), allergies, inflammatory disorders or transplant rejections such as graft versus host disease. The present sequence represents the amino acid sequence of a heavy chain variable region of SM3 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a branched mucin type synthetic glycolipid. A gene fragment encoding the V region of the heavy chain of an antibody recognising the present protein is claimed. The antibody gene fragment is useful for the development of cancer treatments and diagnosing agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amino acid sequence of a synthetic branched mucin type glycolipid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recognising branched mucin type synthetic glycolipid - using gene fragment of an antibody, useful in cancer treatment and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Branched mucin type glycolipid; V region; heavy chain; antibody; cancer treatment; diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a process for preparing a crystal using cadmium. Structure factors or structural coordinates obtained from the crystal of SM3 antibody bound to an epitope can be used to design mimics of the antibody or the epitope. The crystals—comprise at least an epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SM3 antibody; epitope; mimic; crystal; tumour; MUC1 epitope; allergy; immune response; arthritis; multiple sclerosis; asthma; diabetes; inflammatory disorder; transplant rejection; graft versus host disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the heavy chain variable region for monoclonal antibody (Nab) 488, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridoma cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or meutralising the heavy metals in biological and inanimate systems. It can be used in such compositions as perfumes, commetics, plarameceuticals, health care products, skin treatment products, pesticides, health care products, skin treatment products, pesticides, health care products and production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of specific heavy metals.

The present invention describes a monoclonal antibody (MAD) (1) that binds to a human breast cancer antigen that is also bound by MAD 454C11 and 52C9 (produced hybridoma ATCC (HB8484 and HB8696, respectively). Also described is a hybridoma that produces (1). (1) is useful in specific binding assays, affinity purification, drug or toxin targeting, imaging, and genetic or immunological therapeutics for various cancers. The present sequence represents a VH domain derived from a 2G3 hybridoma, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Monoclonal antibody capable of binding to human breast cancer antigen useful for affinity purification, drug or toxin targeting, imaging, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

MAD Br-3 (IGG1) binds to an antigen that is expressed on the surface of human lung, breast, colon and ovary carcinomas, but not on most normal adult tissues. The heavy chain and light chain variable regions (see also AAW06211) of B38-1 can be linked to human constant regions and expressed in transformed host cells. Novel mouse-human chineric antibodies (see also AAW06209-10 and AAW06213-18) can be produced that have specificity to human tumour antigens and can be used for the treatment and

The sequence was used to create chimeric mouse-human immunogalobulins which recognise the human tumour antigen bound by antibody ING-1 (produced by hybridoma cell line ATCC HB 9812). The chimeric antibodies also have an antigen-binding site that competitively inhibits the binding of antibody inG-1, and mediate complement-dependent cytolysis of target cells or antibody-dependent cellular cytotoxicity to target cells or chimeric antibodies can be used for therapeutic purposes in the

polynucleotide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protoxos or helmhiths. The autoimmune diseases, bacteria, fungi, sclerosis, Grave's disease, antkylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. Sequences AAU72810-AAU72815 represent the NKG2D receptor and the polypeptides of the invention.

                                                                                                             The sequence is used in the prodn. of a chimeric antibody mol. comprising two light chains and two heavy chains, each having a constant region (human) and a variable region (murine) having specificity to an antigen bound by murine monoclonal antibody (MAD) Br-3. The chimeric antibodies can be used for any purpose for which the original murine MADs can be used, with the advancage that they are more compatible with the human body. They are esp. used for the diagnosis and treatment of cancer.
